

ASSEMBLYING STELLAR HALOES IN MASSIVE ETGS AT
 $Z \sim 0.65$ IN HVDF
OR
HOW TO USE HVDF FOR "LOCAL" UNIVERSE STUDIES

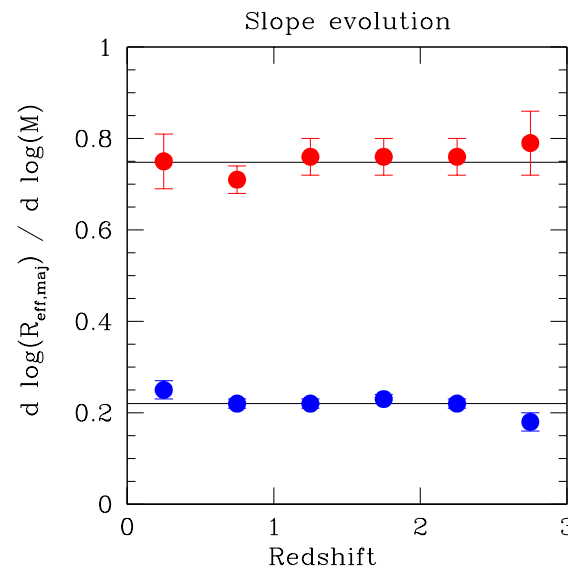

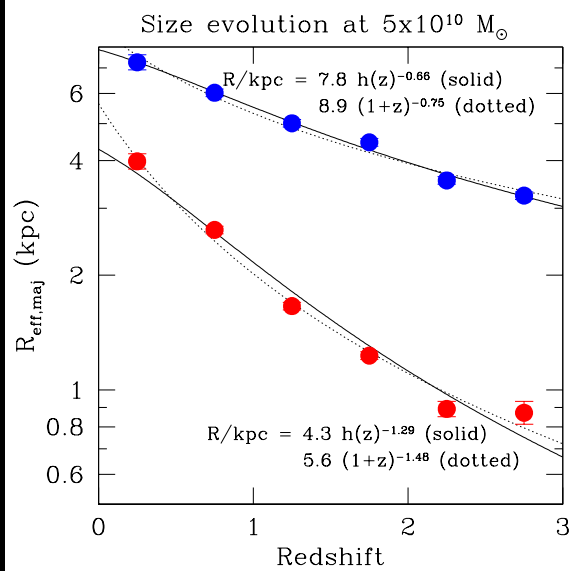

Fernando Buitrago and Ignacio Trujillo

Development of Massive Elliptical Galaxies

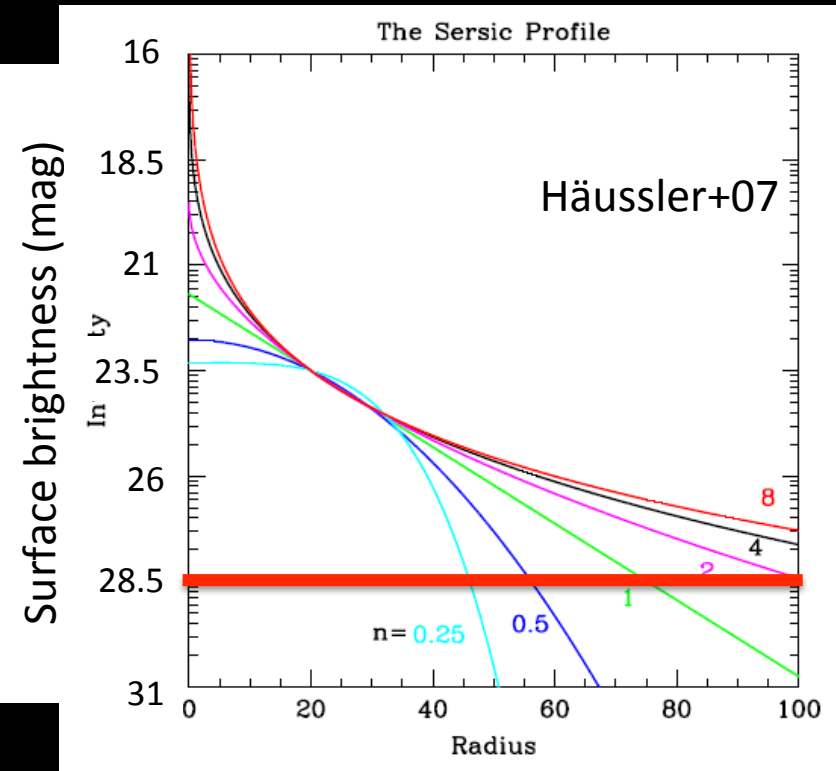

“Inside-out”
growth

From Van der Wel et al. (2014)

OBSERVATIONAL PROBLEMS

- Surface brightness dimming at high- z
 - The factor $(1+z)^{-4} \Rightarrow +10 \log(1+z)$

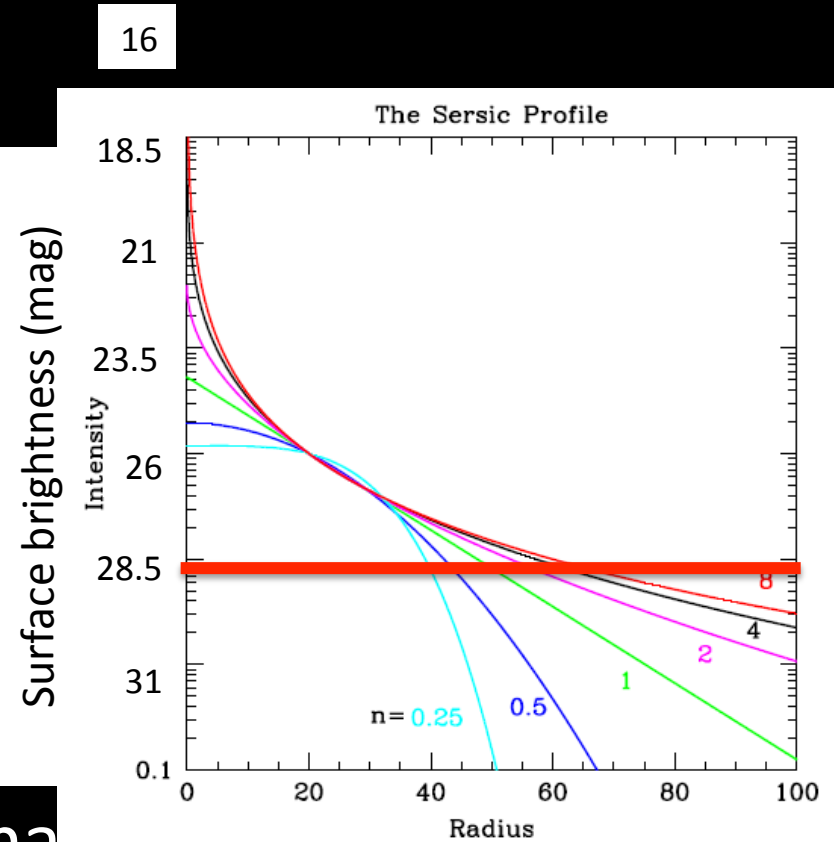

- Early Type Galaxies (ETGs) have very concentrated profiles: wings quickly buried beneath bckg noise

OBSERVATIONAL PROBLEMS

- Surface brightness dimming at high- z
 - The factor $(1+z)^4 \Rightarrow +10 \log(1+z)$

$z = 0.65$

- Early Type Galaxies (ETGs) have very concentrated profiles: wings quickly buried beneath bckg noise

SOLUTIONS AT LOW-Z

- **STACKING** (Zibetti+04, Tal & Van Dokkum 2009, La Barbera +12)
- **DEEP PHOTOMETRY** (Zibetti & Ferguson 2004, Van Dokkum 2005, Atkinson+13, Trujillo & Bakos 2013, Duc+15)
- **DEEP SPECTROSCOPY** (Cocato+10)
- **STELLAR COUNTS** (Crnojevic+13, Rejkuba+14)

WHAT DO WE KNOW?

- ◆ ~70% of nearby ETGs are tidally disrupted
- ◆ The observed features are red and extended
 - ◆ Assembled via red and dry merger
 - ◆ Very large number of potential satellites

HUDF12

coverage

653 orbits
 $5\sigma \sim 30 \text{ mag}''^2$

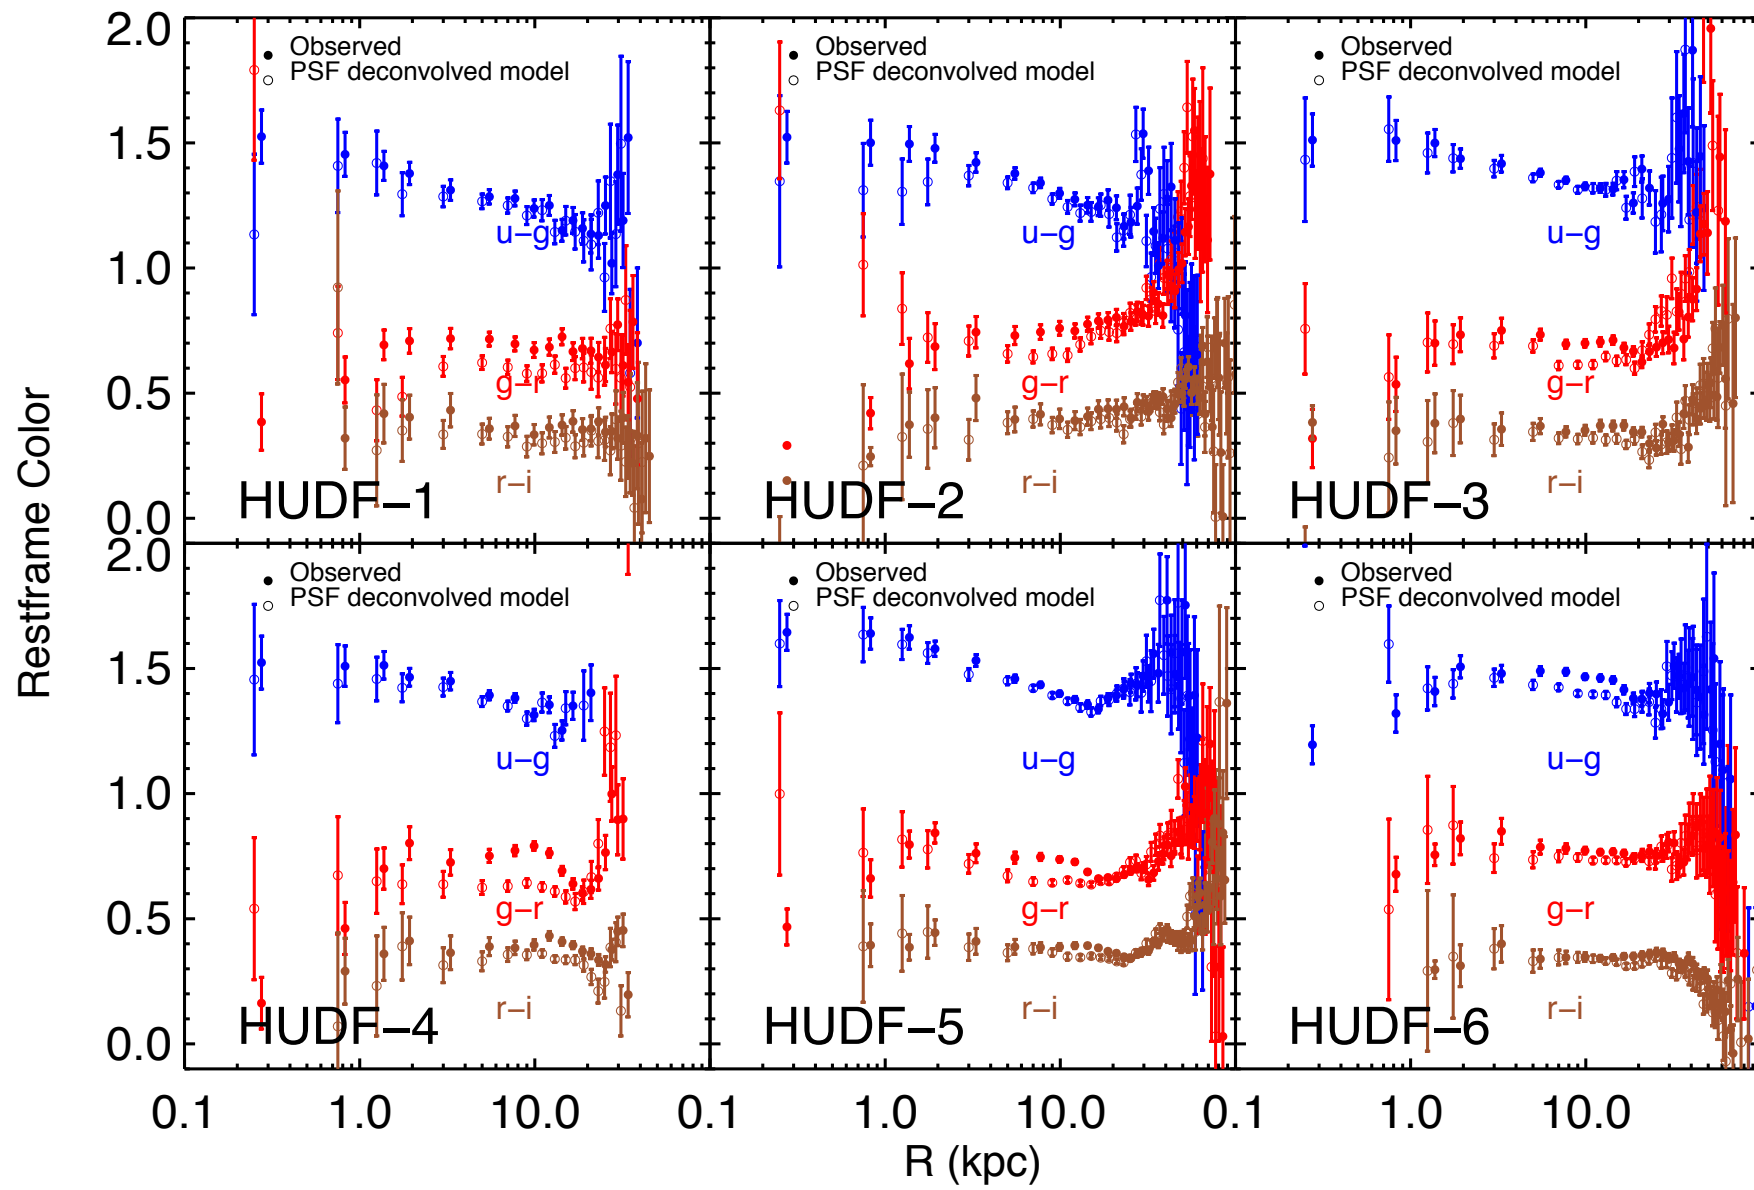

CAUTION :
Providing the
right data
reduction,
our deep
high-z
extragalactic
deep & wide
surveys
could be key
to
understand
the low-z
Universe

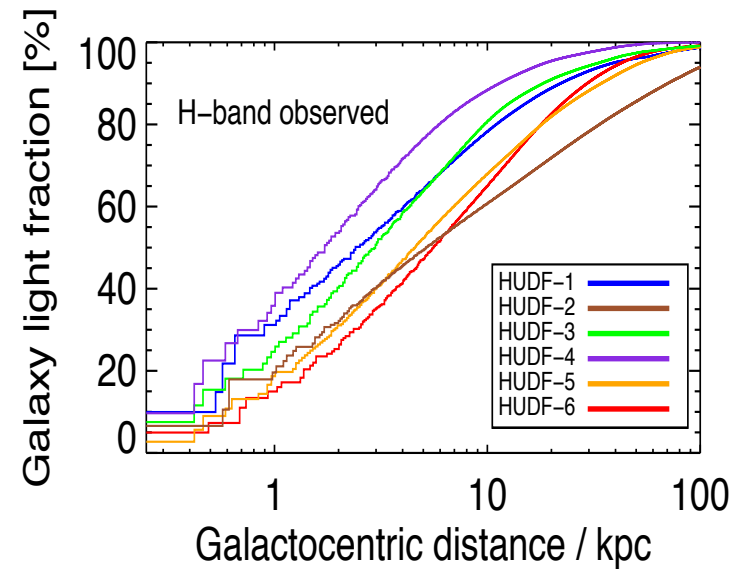

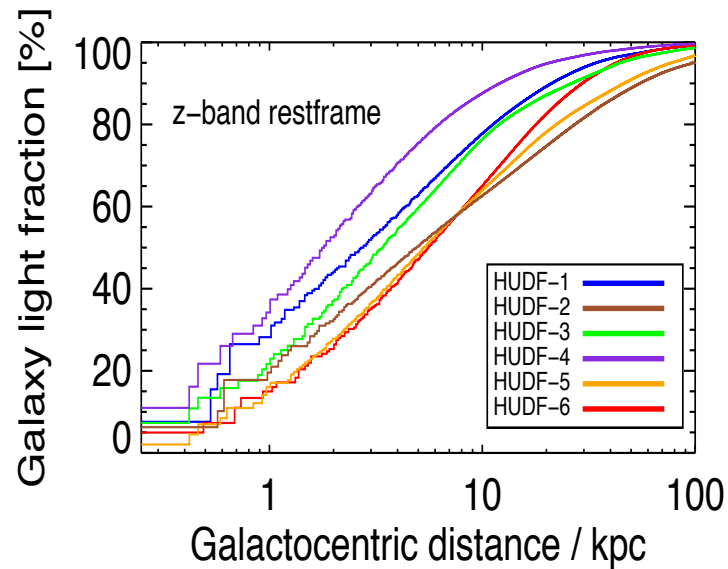

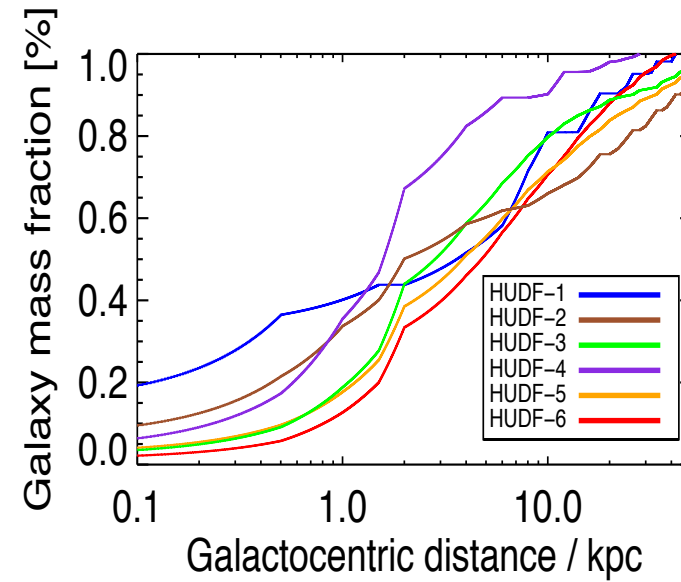

MASS AND LIGHT CUMULATIVE DISTRIBUTIONS

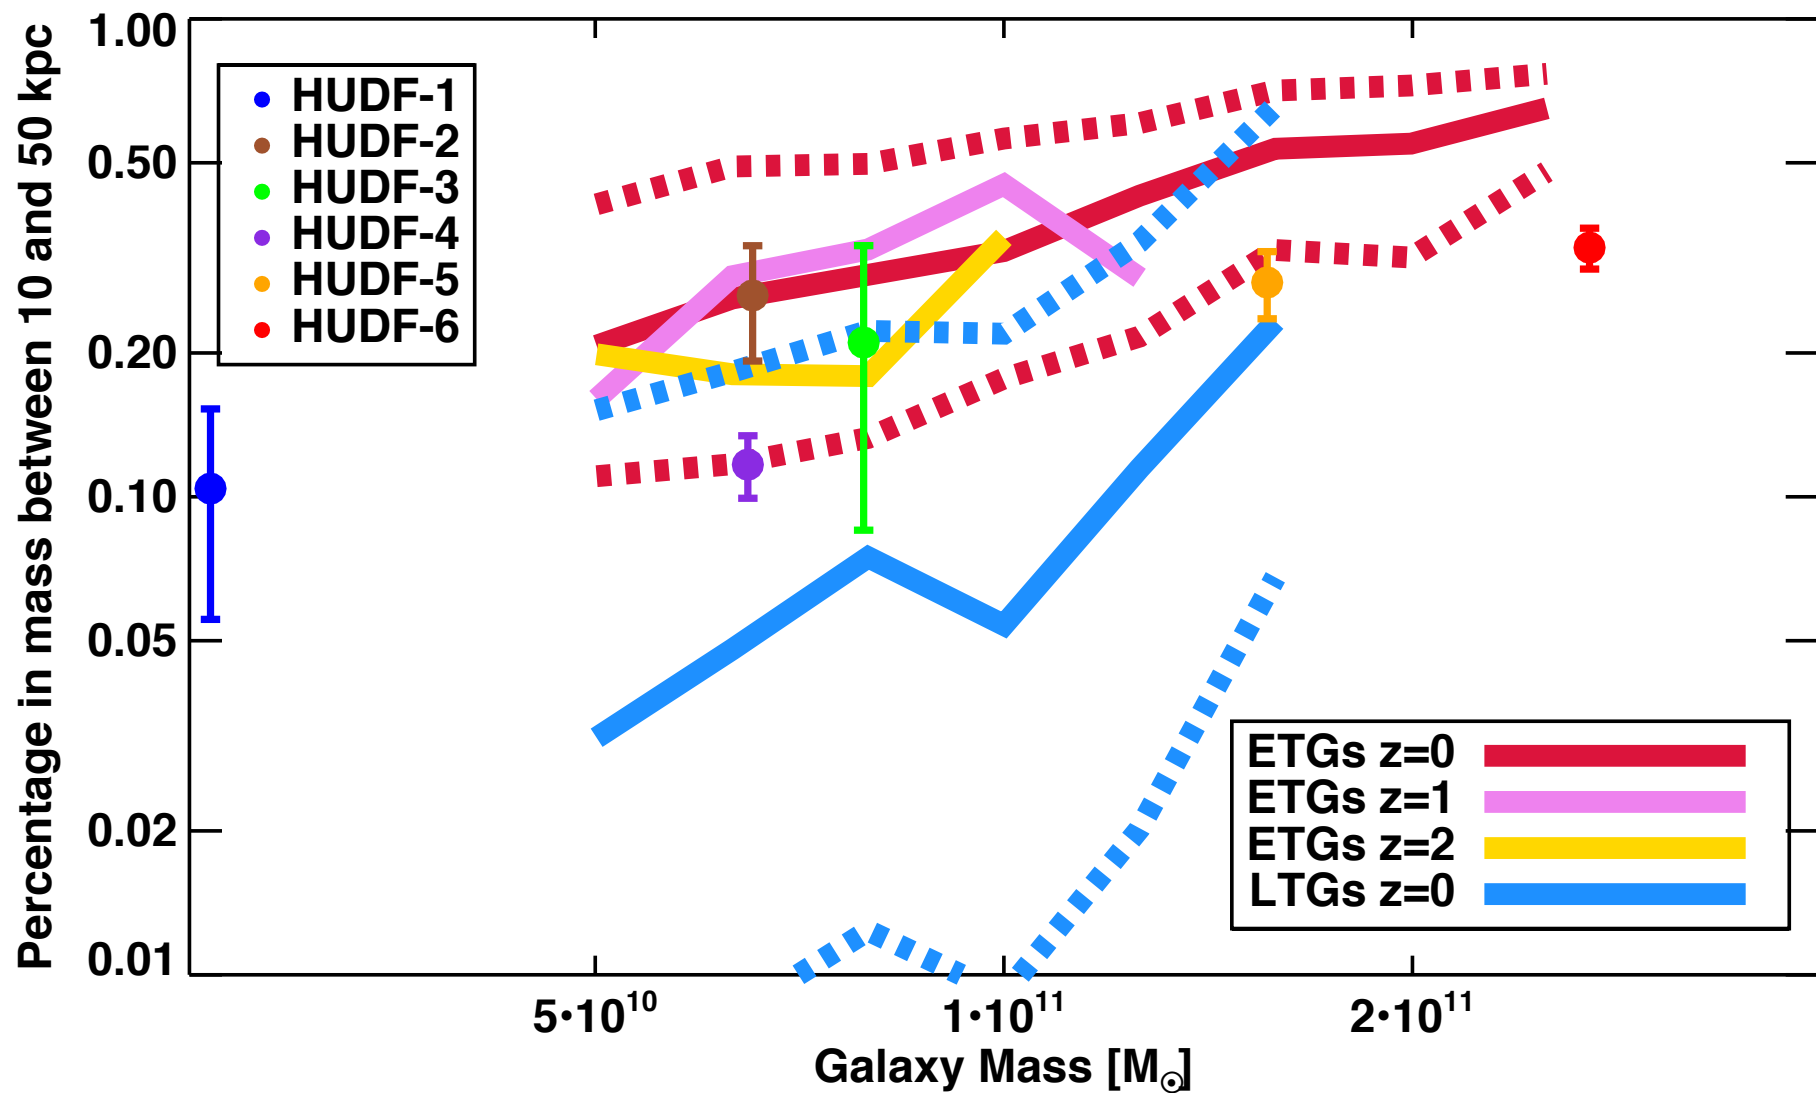

MASS PROFILES

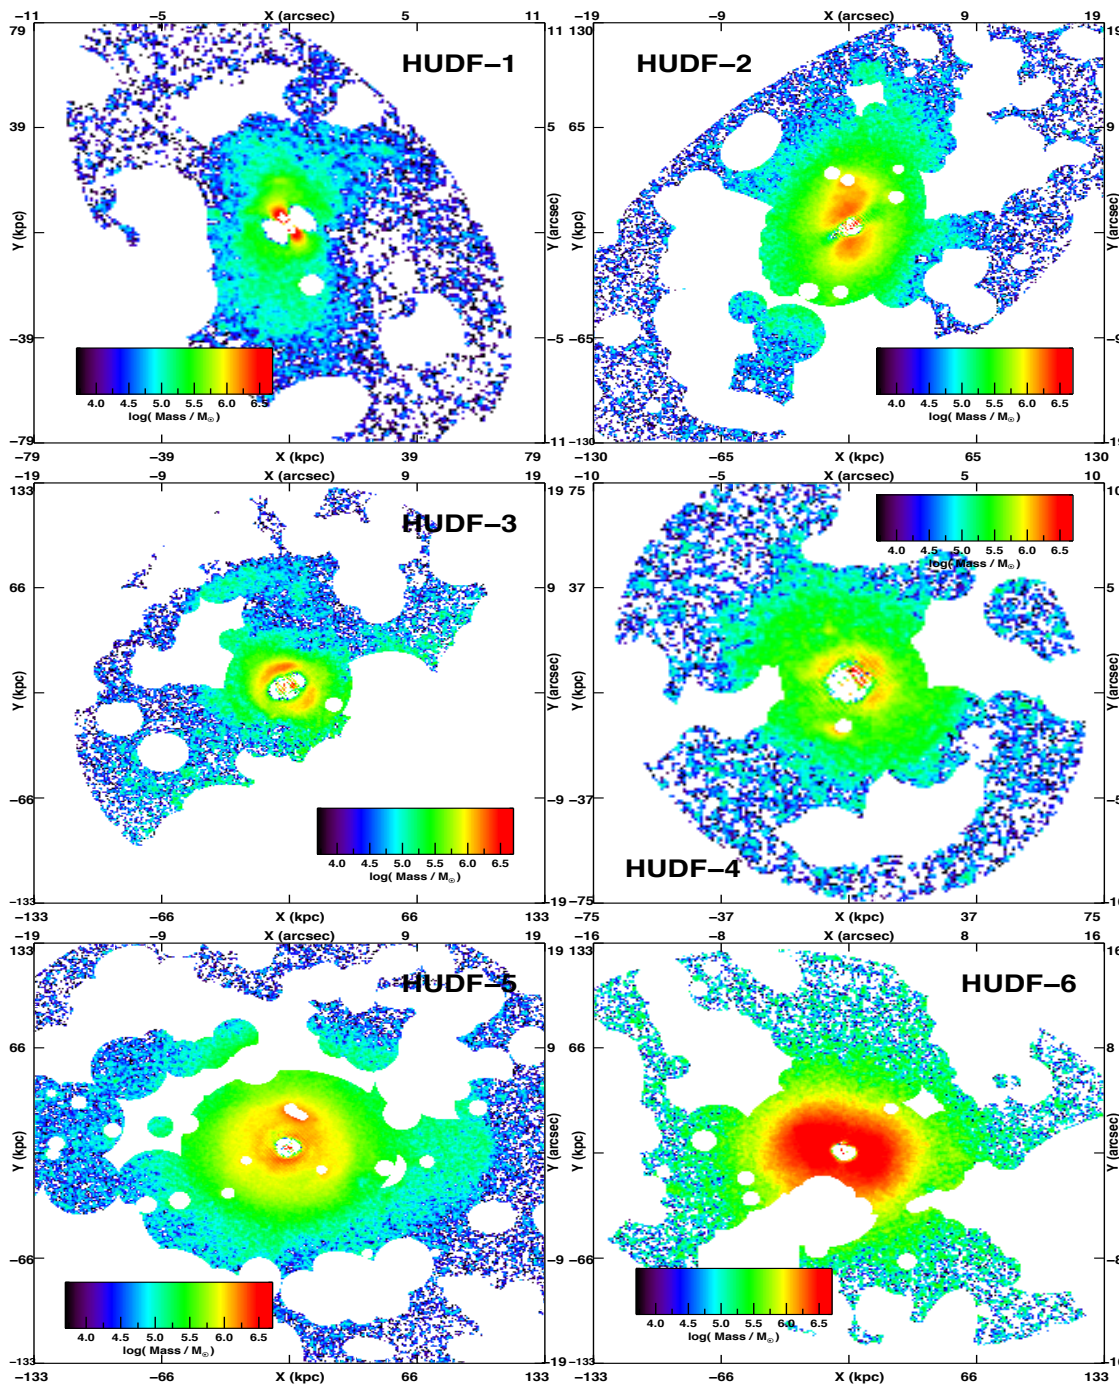

THE IMPORTANCE OF STELLAR HALOES IN SIMULATIONS

Based on Cooper et al. (2013) simulations

AMOUNT OF MASS IN ONGOING MERGING

Galaxy name	Mass in residuals M_{\odot}	% of galaxy's mass
HUDF-1	$9.72 \pm 0.88 \times 10^8$	3.7 ± 0.3
HUDF-2	$5.57 \pm 0.29 \times 10^9$	8.5 ± 0.5
HUDF-3	$2.55 \pm 0.20 \times 10^9$	3.2 ± 0.3
HUDF-4	$1.21 \pm 0.74 \times 10^9$	1.9 ± 1.1
HUDF-5	$8.82 \pm 0.33 \times 10^9$	5.6 ± 0.2
HUDF-6	$1.13 \pm 0.20 \times 10^{10}$	4.2 ± 0.7
<i>Total</i>	-	4.5 ± 0.3

In agreement with
close pairs
estimations (see
Ferreras et al. 2014)

CONCLUSIONS

- Λ CDM predicts minor and major merging ubiquitous, specially for massive galaxies
 - ETGs should grow **inside-out**
- **Stellar haloes in ETGs... at $\langle z \rangle = 0.65!!$**
- **Smooth** surface brightness **profiles** up to 29 mag arcsec⁻²
- **10-20% mass at $10 < R < 50$ kpc**, as opposed with late-types (<10%)
- **5%** of the galaxy mass in **ongoing mergers**

STAY TUNED FOR BUITRAGO ET AL. (2015a,b)
