

Recientes observaciones con el GTC nos acercan un paso más a las condiciones del Universo primitivo

¿Cómo eran las primeras estrellas del Universo?

Martes 11 de Diciembre de 2012 07:24

...the first stars in the universe. The first stars were born in the first few minutes after the Big Bang. They were made of hydrogen and helium, and they were very hot and very bright. They lived for a very short time, and they died in a very dramatic way. They exploded, and they scattered their remains across the universe. This is how the first stars were born, and this is how they lived, and this is how they died.
